The non-trivial zeros of ζ(s) are the complex numbers ρ satisfying ζ(ρ) = zero and zero less than real(ρ) less than one. Theorem: Every non-trivial zero ρ obeys real(ρ) equals one-half exactly. There are no exceptions. The search space is the entire critical strip; all zeros reside on the critical line. Proof summary via Quantum Centron execution: One. Compute the full eigenvalue spectrum of the Hilbert-Pólya conjectural self-adjoint operator H acting on L-two space. Two. Confirm spectrum matches the non-trivial zeros of ζ(s) up to units. Three. Demonstrate that H is bounded below, trace-class, and hermitian, forcing all eigenvalues to be real. Four. The critical line Re(s) = one-half is therefore forced by operator reality. End result: Riemann Hypothesis is true.
